

Lead and Client Operations Dashboard

Case Study - Reporting and visibility layer built in Power BI on top of lead management and client onboarding workflow systems

Overview

This project was built as the reporting and visibility layer on top of two earlier workflow projects: an AI-assisted lead management and follow-up workflow, and a client onboarding automation workflow. The goal was to move beyond just running workflows and create operational visibility into lead status, follow-up workload, onboarding progress, override cases, and bottlenecks across the process.

1

connected operations view

Problem

Once workflow systems are built, a new problem appears: visibility. Without a reporting layer, it becomes difficult to see what is pending, which cases need action, where follow-up pressure is building, or where the onboarding process is getting delayed. The workflows may exist, but there is no strong operational view of what needs attention.

Objective

The objective of this project was to build a dashboard that could monitor both the lead and onboarding sides together, create better visibility into action-needed cases, and make the overall process easier to track and explain.

Source Reporting Layers

Before building the dashboard, clean reporting tabs were created in Google Sheets to separate workflow data properly and prepare it for Power BI.

- Lead_Workflow_Final
- Onboarding_Workflow_Final

The reporting preparation work included separating lead and onboarding data, fixing date formatting issues, correcting column mismatches such as Next Follow-up Date versus Follow-up Count, and structuring both layers so they could be imported cleanly into Power BI.

Dashboard Structure

Page	Purpose	Main contents
Executive Overview	Top-level control view	Total Leads, Onboarding Clients, Info Pending, Kickoff Ready, Onboarding Complete, Follow-Ups Pending, Override cases, Action Needed table
Lead Funnel & Follow-Up	Lead-side monitoring	Lead status distribution, follow-up count distribution, pending follow-ups, override cases, lead activity table
Onboarding Stages	Onboarding-side monitoring	Onboarding stages chart, Information Pending, Kickoff Ready, Onboarding Complete, Override, pipeline/action-needed table
Action Needed / Bottlenecks	Operational control page	Pending lead follow-ups, pending onboarding information, lead override cases, onboarding override cases

My Role

My role in this project was to structure the reporting layer, clean the workflow data, define the dashboard page layout, and make the dashboard more consistent in terms of title style, spacing, and table placement. I also worked through what should appear at an executive level and what should remain in a more detailed operational view.

What This Project Demonstrates

- reporting and dashboard thinking
- workflow visibility design
- business analysis mindset
- bottleneck and action-needed tracking
- practical use of Power BI on top of workflow systems
- ability to connect multiple workflow projects into one operating story

Outcome

The V1 dashboard was built and made presentable enough to explain and use as proof of work. More importantly, it changed the overall project story from “I built automations” to “I built workflow systems with reporting, visibility, and bottleneck tracking.”

Short Portfolio Version

Built a Lead and Client Operations Dashboard in Power BI as the reporting and visibility layer on top of an AI-assisted lead workflow and a client onboarding automation workflow. Cleaned reporting tabs in Google Sheets, fixed date and column issues, imported both workflow layers into Power BI, and built a 4-page dashboard covering executive overview, lead funnel and follow-up tracking, onboarding stages, and action-needed bottlenecks.
